                                                                                                                                                                                                                                                                                                                                                                                        Composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease
                                                                                                                                    Tighe is a glycoprotein with an Mr of about 25,000. The partial amino acid sequence of purified bother Tighe indicated no homology to other known growth factors. However the N-terminal sequence exhibits considerable amino acid sequence identity to the deduced N-terminal amino acid sequence of human granulin A and the N-terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                   ranulin; epithilin; human; growth factor; autocrine; tumour; viral infection; antagonist; therapy; diagnosis; antigen;
                                                                                 Transforming growth factor E produced in commercial quantities used for wound healing and burns treatment, comprises monomeric protein which acts as mitogen for fibroblasts
                                                                                                                                                                                                                                                                                                             853 GATGTGAAATGTGACATGGAGGTGAGCTGCCCAGATGGCTATACC 897

A patient with a form of chronic myelogenous leukemia underwent two treatments of cytophoresis from which basophils were recovered. These were used to search for novel basophil granule proteins (BGP). The proteins were fractioned. Ca. 25 peaks were identified. Several fractions were pure enough to allow for the determination of a single amino acid sequence. The N-terminal sequences of eight
This is the amino acid sequence of peptide A14R, comprising amino acid residues A566-R579 of human GPB8 (see AAMB5475). GPB8 is an 88 kbg ajvoprotein autocrine growth factor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. A14K was used in an attempt to raise neutralising antibodies to GPB8 (see also AAWB5480). Anteagonists to GPB8, such as anti-GPB8 antibodies, are used to treat diseases associated with increased expression of GPB8, particularly cancer but also viral infections. Anti-GPB8 antibodies can also be used
                                                                                                                                                                                                                                                                                                                         but also viral infections. Anti-GP88 antibodies can also be used as diagnostic reagents and to deliver toxins or other compounds to

TGFe is a glycoprotein with an Mr of about 25,000. The partial amino acid sequence of purified bowine TGFe indicated no homology to other known growth factors. However the N-terminal sequence exhibits considerable amino acid sequence identity to the deduced N-terminal amino acid sequence of human granulin A and the N-terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transforming growth factor E produced in commercial quantities -
used for wound healing and burns treatment, comprises monomeric
protein which acts as mitogen for fibroblasts
                                                                                                                                                                                                                                                                                                      Transforming frowth factor e; cell proliferation; mitogen.
                                N-terminal âmino acid sequence of epithelin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR51665 shows an N-terminal sequence of a basophil granule protein. The BGP can be extracted from human basophil granules by treatment at pH 9.0 or greater. This can be used to generate its corresponding nucleic acid an antibodies. Anti-BGPs are useful for the diagnosis of prepathologic conditions as well as chronic and acute diseases, such as parasitic infection and leukaemia, where there is a change in the amount or distribution of BGPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human basophil granule proteins - and related nucleic acid, expression systems, antibodies, etc., for diagnosis and treatment of e.g. inflammation, parasitic infection, leukaemia etc.
such fractions are represented in AAR20736-42 and AAR22455.

The present sequence is one of twenty overlapping peptides corresponding to the N-terminal 148 residues of the PrtR27 adhesin from Porphyromonas coingivalis. Antibodies directed towards the PrtR27 adhesin were found to provide protection against periodontitis in a human patient and immunoprotected mice. The peptides were used for epitope mapping of the prtR37 adhesin. Peptides comprising at least one P. gingivalis epitope are useful in the treatment and prevention of periodontal disease, particularly periodontitis, which is associated with P. gingivalis particularly periodontitis, which is associated with P. gingivalis infection. The peptides are useful as immunosens in vaccine formulations infection. The peptides are useful as immunosens in vaccine formulations incontain an include operation and peptide-specific antiserum useful for passive immunisation, and to generate polycional or monoclonal antibodies. The immunisation and antibodies against the peptides can be used in diagnostic tests to detect P. gingivalis infection. The antibodies can also be used in oral compositions such as toothpaste and mouthwash to neutralise the

                                                                                                                                                                                                                                                                                This is the amino acid sequence of peptide S14R, comprising amino acid residues S562-R575 of murine GP88 (see AAW85474). GP88 is an KDa glycoprotein autocrine growth factor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, uncrigenic cells. S14R was used to raise neutralising antibodies to GP88. Antagonists to GP88, such as anti-GP88 antibodies are used to treat diseases associated with increased expression of GP88, particularly cancer but also viral infections. Anti-GP88 antibodies can also be used as diagnostic reagents and to deliver

The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoletin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thiosesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that ma be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms.
                                                                                                                                                                                                                                                               Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         platelet derived growth factor; PDGF; smooth muscle; mimic; interaction site; constrained conformation; inhibitor.

                                                                                                                                                                                                                                                                                                                               Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFs and APIs correlates with the severity of Alzheimer's Disease. The present sequence is a peptide produced from an API by proteolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or plasma. The abundance of the AFS and APIS is then normalised to an Expression Reference Protein Isoforms (BEPI) in

                                                                                                                                                                                                                         are derive from PDGF peptides that contain proline or proline/cysteine brackets. These peptides that contain proline or proline/cysteine brackets. These peptides contain one or more interaction sites of interest. The dose is 5-5000 microcomoles. The peptides interact with specific receptors and inhibit the migration of macrophages, and thus inhibits the pro-inflammatory effects of the interleukin. The data collected demonstrates that interaction sites possess activity when present in a polypeptide that differs from the native form. Inclusion of conformation-constraining moleties can have desirable effects on an interaction site. (Also see AR&FOIN-117 and AAR&FOIL-52 for analogues of other biologically active peptides contg. an interaction site flanked by conformation constraining 9ps., eg. RGD peptides.)
                                                                                                                                    Peptide homologue or analogue with constrained conformation - has proline residues flanking the interaction site to impart greater, or more stable, biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polypeptide(s) having affinity for the human TSH receptor antibody - used in detection of the TSH antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       thyroid stimulating hormone receptor; TSH; human; Homo sapiens; antibody; affinity; detection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                To obtain a pollovirus-1 (PV1)/Chlamydial hybrid, the PV1 Mahoney CDNA clone pT7XLD was modified to encode epitopes from C. trachomatis ser. A MOMP VDI. The VOI sequence was not restricted to the known epitope given in AAR66356, or to the sequence given in AAR66383 (expressed in previously described hybrids), but instead included adjacent sequences from VDI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a composition comprising an isolated oestrogen receptor activity inhibiting (anti-oestrogen) peptide. The peptides used in the composition comprise sequences of human oestrogen receptor (OR) surrounding Tyr537 and steroid receptor co-activator-1 (SCR-1). The peptide compositions, nucleic acids and vectors of the present invention can reduce OR activity in a cell, reduced OR polypeptide dimerisation in a cell and reduce the binding of SRC-1 polypeptide to an OR polypeptide dimer in a cell. They can be used for killing cancer cells and treating cancers, particularly breast cancer. The present sequence represents a specifically claimed anti-oestrogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New anti-oestrogen peptide compositions - comprise sequences based on oestrogen receptor and steroid receptor co-activator-1 sequences, used for treating cancers
                                                                                                                                                                                                                                                                                                               breast cancer; estrogen; tumour; phosphotyrosyl peptide; malonyltyrosyl peptide; steroid receptor co-activator-1.

bloactive compounds. To ensure specificity and optimize binding, the sensor is generally present at sub-micromolar concentration and the binding reaction occurs in solution. The sensor peptide obviates the need to include a natural coactivator protein of the receptor in the mixture. Sequences AAX1371-587 represent examples of sensor peptides that can be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hormone receptor function. The methods use a sensor peptide covalently coupled to a detectable label, that provides direct, in vitro ligand-dependent binding to a nuclear hormone receptor. Panels of predetermined or randomized candidate sensors are readily screened for receptor binding. The methods and compositions provide for efficient screening of modulators of nuclear hormone receptor function, without the use of cell- or gal-based steps. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for

into sequence tepteseuts on mandam nucted protein. This peptide in the DNA binding domain (DBD) of the SRCia protein. This peptide corresponds to amino acids 748-75 of SRCia-DBD. The invention relates to the identification of inhibitor compounds capable of reducing the interaction between a region on a nuclear protein (RI) and a region on a nuclear protein (RI) and a region on a nuclear protein (RI) and a region on a nuclear protein satisfic (II) R2 is the region capable of interacting with the nuclear protein by binding the signature motif; (II) the nuclear protein is a bridging factor responsible for interaction between a liganded nuclear receptor and a responsible for interaction between a liganded nuclear receptor and transcription initiation complex involved in gene expression regulation; (IV) the nuclear experts in a transcription factor; (V) the signature of a nuclear protein which binds to a liganded nuclear receptor during of a nuclear protein which binds to a liganded nuclear receptor during a citivation or repression of target genes. The inhibitors are expected to be useful in the treatment of any disease mediated through any interaction between a signature motif on a nuclear protein and a nuclear receptor, for example inflammation and cancer.
                                                                             cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence represents an LXXLL nuclear protein signature motif found
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identification of inhibitors of nuclear protein/nuclear receptor interaction - useful for, e.g. treatment of disease mediated through the interaction such as inflammation and cancer
                                                                         Nuclear protein; signature motif; receptor protein; inflammation; interaction; inhibitor; inhibition; transcription factor; ligand.

```

This sequence represents a peptide fragment of the E.Coli 50s ribosomal subunit L17 identified and characterised using a novel method of the invention. The invention comprises a method for labeling a protein by protecting epsilon-amino groups of Lys, cleaving the protein to produce a mixture of peptides and treating these with a labeling agent that binds to the N-terminal amino acid. The method is used for identifying proteins, e.g. for analysis of proteins expressed by cells in different expression states. The method makes possible relative protein againstitation in one- or two-dimensional gel separations, even when separation is only partial, and facilitates de novo sequencing and automated interpretation of mass spectra. Protection of Lys sidechains ensures specific labeling of the N-termina, increases the intensity of belong the communication of the store of the sidechains and protein the sequence of the sidechains are communicated to the sequence of the sidechains are communicated to the sequence of the sidechains and protein the sequence of the sidechains are communicated to the sequence of the sequence of the sidechains are communicated to the sequence of the sidechains are communicated to the sequence of the sidechain are communicated to the sequence of the s

Method for labeling proteins, useful for identification, particularly in expression analysis, by blocking lysine sidechains, proteclysis and N-terminal labeling of peptide fragments

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW42528
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       condition and provided and displayed and which acts as modulator of VEGF function. The compound is useful for: treating a modulator of VEGF function. The compound is useful for: treating a patient suffering from psoriasis, rhemmatoid arthritis, retinopathy and cancer; for imaging and assessing necvascularisation during angiogenesis; for detecting VEGFR-2 receptor or related receptor on living cells, as a calbration standard for quantitating the activities of candidate VEGFR-2 antagonists in a variety of functional assays; as probes for affinity screening; as blocking reagent in random peptide screening i.e. in screening for new families of VEGFR-2 peptide ligands; in the co-crystallisation with VEGFR-2; in inhibiting or decreasing the proliferation and growth of vascular endothelial cell growth configuration and diagnostic applications where VEGFR-2 is antagonised. Agonists are useful for the treatment of diseases such as coronary artery disease. This sequence is a peptide modulator of the cyascular endothelial growth factor receptor-2 (VEGF-2) based on the community peptide sequence ANS73422, described in the method of the

A melanoma-specific immunogen homologous with pwel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group AAR82098-AAR82194 capable of eliciting a CTL response. The epitopes AAR82098-AAR82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pwel-17 are highly potent stimulators of HiA-A2+CTLs in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Metastatic melanoma; peptide analogue; vaccine; cancer; diagnosis; antigen; CTL; immunogenic; viral disease; gp 100; Melan A/MART-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAW42528;
                                                                                                                                                                                                                  Sequence
```

```
This sequence is shown in the specification. The invention relates to peptides, which are immunogenic with lymphocytes directed against metastatic melanomas. They are characterised in that they comprise at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Tpr-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in reactive tumour infiltrating lymphocytes, which can also be used in cracines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and

The present invention describes the use of a ligand binding domain (LBD) transcription factor (TRX) fusion protein in methods for identifying transcription of actor (TRX) fusion protein in methods for identifying agonists or antagonists for ligand-induced activation of a predetermined auchies areceptor having a LBD. Also describes are: (1) a positive hybrid nuclear receptor signal transduction system, comprising an infact comprising a reverse hybrid reporter host cell; (2) a nuclear receptor signal transduction system, comprising a reverse hybrid reporter host cell; (3) a multiplexed format assay for identifying nuclear receptor ligands; (4) identifying a candidate pharmaceutical agent from a library of test agents; (5) a confidate pharmaceutical agent from a library of test agents; (5) a confidate pharmaceutical agent from a library of test agents; (5) a confidance nuclear receptor, typically by interaction with a binding to a nuclear receptor at which naturally occurring to a nuclear receptor at which naturally occurring a coactivators and/or corepressors bind; and (6) an agonist ligand of a coactivator and/or corepressors bind; and (6) an agonist ligand of a custom femiliar acceptor having a LBD. The present activation of a predetermined nuclear receptor having a LBD. The present sequence represents a coactivator leucine charged domain peptide, used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NY ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human; leukaemia; non-Rodgkins lymphoma; Hodgkins lymphoma; lung cancer; metastasis; melanoma; adenocarcinoma; thymoma; colon cancer; reterine cancer; cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy;
predetermined nuclear receptor having ligand binding domain (LBD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human cancer antigen NY ESO-1/CAG-3 HLA peptide motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Conservative:

Example 10; Page 43; 88pp; English.
   This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 ORF1 (see AAX5859). 30 Epitopes (see AAX60814-47) were identified.

The present peptide (ranked 14) corresponds to amino acid residues 153-160 of CAG-1 ORF1 (see AAX05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAX05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer capacities. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from cancers corers such as primary or metastatic melanoma, thymoma, Important cancer, cervical cancer, liver cancer, leuksemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and

screen for epitopes from the coding region of human EGO-1/CAG-3 (CAR-1 (See AAX5659). 30 Epitopes (see AAX0618-47) were identified. The present peptide (ranked 22) corresponds to amino acid residues 152-160 of CAG-1 ORF1 (see AAX05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAX05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer c vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, Iymphoma, sarcoma, lung cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, leukaemia, uterine cancer, cervical cancer, broader cancer, leukaemia, uterine cancer, cervical cancer, broader cancer, leukaemia, pancreatic and adenocarcinomas such as breast, prostate, ovarian, pancreatic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; Jung cancer; metastasis; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer; liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy; vaccine; human leukocyte antigen; HLA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY06025
```

This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-17CAG-3 ORF1 (see AAX58599). 30 Epitopes (see AAV06018-47) were identified. The present peptide (ranked 8) corresponds to amino acid residues 154-162 of CAG-1 ORF1 (see AAY05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAV05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptides (var with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers.

Nuclear hormone receptor drug screens

Claim 7; Page 18; 29pp; English.

hormone receptor function. The methods use a sensor peptide covalently coupled to a detectable label, that provides direct, in vitro ligand-dependent binding to a nuclear hormone receptor. Penels of predetermined or randomized candidate sensors are readily screened for receptor The invention provides methods for screening of modulators of nuclear

modulators of nuclear hormone receptor function, without the use of cell- or gel-based steps. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for bioactive compounds. To ensure specificity and optimize binding, the sensor is generally present at sub-micromolar concentration and the binding reaction occurs in solution. The sensor peptide obviates the need to include a natural coactivator protein of the receptor in the mixture. Sequences AR13571-587 represent examples of sensor peptides that can be used in the method of the invention. binding. The methods and compositions provide for efficient screening of Cytotoxic T-lymphocyte response; CTL; antigen; lymphatic system; immunisation; tumour; infectious disease; immunotherapy; cancer; malignant melanoma; viral disease; hepatitis; AIDS. 00000 Conservative: Mismatches: Matches: Indels: Length: HLA Class I motif peptide SEQ ID NO:463. The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the inventoologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor of antigen in the lymphatic system of a mammal so as to provide a sustained CTL response, used to treat, e.g. AIDS Disclosure; Page 45; 199pp; English. disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milieu of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAY10071 to AAY10639 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cancer testis tumour antigen; NY-ESO-1; LAGE-2; human leukocyte antigen; HLA; HLA binding peptide; major histocompatibility complex; MHC; tumour; cancer; testis tumour.

individual that comprises determining the ratio of phospho-tau (181)/
total tau. Tau and phospho tau are useful as neurological markers for the
manufacture of a diagnostic kit for the diagnosis of a tauopathy and/or
the differential diagnosis of a tauopathy versus a non tauopathy. A
phospho-peptide liable to form an immunological complex with monoclonal
antibody HT7 and MAD AT270 comprising at least the minimal epitope of HT7
or AT270 is useful to measure phospho-tau levels and diagnose a tauopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and/or for the differential diagnosis of a tauopathy versus a non tauopathy. The kit is useful for the diagnosis of Alzheimer's disease, Pick's disease, sporadic Frontotemporal dementia and/or Frontotemporal dementia and/or Frontotemporal dementia with Parkinsonism linked to chromosome 17, Creutzfeldt Jacob disease, stroke and/or neurotoxicity in patients with leukemia. The prosphopeptide kits and methods are useful for therapeutic monitoring and for determining the effectiveness of a treatment. Sequences ABBS5641-64 represent synthetic peptides immunoreactive to tau antibodies HT7, taul,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the ratio of phospho-tau / total tau is useful for diagnosing a tauopathy i.e. Alzheimer's disease or Pick's disease, versus a non tauopathy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a method of diagnosis of tauopathies in an

bind to human leukocyte antigens (HLAS). NY-ESO-1 is a molecule that is processed to at least one human leukocyte antigen (HLA) binding peptide, which binds to class I and class II major histocompatibility complex (HGC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of

especially

cancer,

                                                                                                                                                                                                                              AAU02257
                                                                                                                                                                                                                                                                                    The invention provides a method of diagnosis of tauopathies in an individual that comprises determining the ratio of phosphortau (181)/
total tau. Tau and phospho tau are useful as neurological markers for the manufacture of a diagnosit kit for the diagnosis of a tauopathy and/or the differential diagnosis of a tauopathy versus a non tauopathy and/or phospho-peptide liable to form an immunological complex with monoclonal antibody HT7 and MAD AT270 comprising at least the minimal epitope of HT7 or AT270 is useful to measure phospho-tau levels and diagnose a tauopathy and/or for the differential diagnosis of a tauopathy versus a non tauopathy. The kit is useful for the diagnosis of Alzheimer's disease, pick's disease, sporadic Frontotemporal dementia and/or Frontotemporal dementia and/or neurotoxicity in patients with leukemia. The phosphopeptide kits and methods are useful for therapeutic monitoring and for determining the effectiveness of a treatment. Sequences AMBSS641.64

AAU02225-AAU02384 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HLA A0201, HLA A0205, HLA A1, HLA B24, HLA B27, HLA B2702, and HLA B40203. Tumour antigen derived gene-16 protein, TADG-16 (AAU02223), is a novel human extracellular serine protease. TADG-16 (AAU02223), is a novel human conserved catalytic triad, His-Asp-Ser, and a signal secretion sequence characteristic of the serine protease family. An antisense oligonucleotide having a complementary sequence to the TADG-16 nucleic acid is useful for treating various cancers, including ovarian, breast, antibodies specific to TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 are useful for the diagnosis of cancer.

oligonucleotide having a complementary sequence to the TADG-16 nucleic acid is useful for treating various cancers, including ovarian, breast, lung, colon and prostate. The TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 are useful for the diagnosis of cancer. TADG-16 protein or its fragments are useful for vaccinating an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAU02225-AAU02384 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HLA A0201, HLA A0205, HLA A1, HLA A24, HLA B7, HLA B8, HLA B2702, and HLA B4403. Tummour antigen derived gene-16 protein, TADG-16 (AAU02223), is a novel human extracellular serine protease. TADG-16 is expressed in normal ovaries and testes and in certain ovarian carcinomas. TADG-16 contains the conserved catalytic triad, HLS-A5P-Ser, and a signal secretion sequence characteristic of the serine protease family. An antisense

The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained form assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for determining whether a cancerous in patients receiving treatment for a melanoma, adenocarcinoma, non-small cell lung carcinoma or bladder carcinoma.
                                                                                                                                                                                                                                                                                                                                                       Method useful for determining the status (e.g. progression, regression or stability of the disease) of a cancerous condition, involves determining the levels of NY-ESO-1 specific antibodies in a sample

The invention describes a composition comprising an immunogenic peptide having a human leucocyte antigen (HLA)-A2.1 binding site. The peptides bind specifically to HLA-A2.1, to cause T cell activation and thus a cytotoxic T cell response. The peptides and the nucleic acids that cytotoxic T cell response. The peptides and the nucleic acids that encodes them, are used, in vivo or ex vivo, for treatment of viral infections (hepatitis B or C; Epstein-Barr; human immune deficiency; infections (hepatitis B or C; Epstein-Barr; human immune deficiency; Kaposi sarcoma: human papiliona; Lassa fever or dytomegaloviruses); theoris in human papiliona; Lassa fever or dytomegaloviruses); clumours including prostate cancer, renal carcino-embryonal antigen, directed to prostate-specific antigen, p53, carcino-embryonal antigen, corporace directed to trypanosome surface antigen); and condlylome or protozoa directed to trypanosome surface antigen); and condlylome cauminatum. The peptides are suitable for use in peptide-based vaccines. This sequence represents an immunogenic peptide with the human leucocyte antigen (HLA)-A2.1 binding site, described in the
cytomegalovirus; tumour; prostate cancer; renal carcinoma; lymphona; prostate-specific antigen; p53; carcino-embryonal antigen; melanoma antigen; Mycobacterium tuberculosis; protozoa; trypanosome surface antigen; condlyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic peptide with human leucocyte antigen-A2.1 binding site, useful for treating e.g. viral infection or tumours
                                                                                                                                                                                          Æ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New bradykinin analogue with D-beta-(2-napththyl)-Ala,
beta-(2-thienyl)-Ala and D-Phe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    690000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conservative:

The sequences given in AAR93272-342 represent peptides which are SH3 ligands/SH3 binding agents. They represent a biased phage library which comprises six random amino acids flanking the tetrapeptide phich which was identified as a recognition sequence for the src SH3 domain. These sequences were identified using the method of the invention. The method comprises contacting the SH3 domain with a mixture of peptides under conditions permitting a ligand to bind to an SH3 domain to form a complex. Any unbound peptides are removed and the complexed peptide ligands are dissociated from the complexes. The selected peptides are enriched by re-contacting them with the SH3 domain and then candidates which bind to the SH3 domain are detected. The isolated SH3 binding peptides may be used in the diagnosis, prevention and treatment of conditions or diseases resulting from cellular processes mediated by an SH3-based interaction. Such diseases include Paget's disease. Other conditions treatable with these peptides include restenosis, rheumatoid arthritis, gout and other problems in which an SH3 of neutrophil oxidase p47 and p67 complex is
                                                                                                                                                                                                                                                                                                                                                                             Identification of peptide(s) binding specifically to SH3 domains for use in inhibiting interactions mediated by SH3 domains in treatment of e.g. osteoporosis and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chlamydial epitope; variable domain; MOMP;
major outer membrane protein; picornavirus; poliovirus; PV1;
diagnostic; therapeutic; capsid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Conservative:

                                                                                                                                                                                                                                                                    Mahoney CDNA clone PTXID was modified to encode epitopes from C. trachomatis ser. A MOMP VDI. The mutagenesis cartridge was contained between PV nucleotides 2753-91 (given in AAQ79003) which encode PV amino acids 1092-1104 (AAR66375) which include the BC loop of capsid protein VP1 (AAR66386). The polio-specific DNA within the cartridge, encoding the sequence given in AAR66366, was replaced by eligonucleotides encoding VDI peptides AAR66370-74. Viable PV expressing chlamydial immunostimulatory epitope was expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacteriophage peptide library;peptide epitope; therapeutic target;

target molecule, and comprises contacting a screening molecule with a target molecule, and comprises contacting a screening molecule with a variegated compound library, where the screening molecule is chiral.

Target molecule, or the enantioner if the target molecule is chiral.

Compounds which have a desired interaction with the target molecule are selected, and the ability of their enantioner to interact with the target molecule is tested. Ligands for a target protein can be identified by combining a D-fanationer of a target protein can be identified by complining a D-fanationer of a target protein (a D-target protein), and a variegated compound library, and then selecting one or more compounds from the library which have a desired binding interaction with the cartagonists of targets such as receptors, enzymes, DNA binding proteins or signal transduction proteins. The methods can provide a structurally selective approach in addition to scoring for interaction of functional groups. They provide a powerful selection method that allows for the production of ligands with the same diversity as peptides but with the sealty improved pharmacokinetic profiles needed for drug activity.
                                                                                                                                                                                                                       The present sequence represents a consensus sequence obtained after several rounds of selection and amplification of a 6-mer peptide library. The consensus sequence is derived from peptide ligands of a D-enantiomer of interleukin-8 (IL-8), and was obtained using the method of the invention. This novel method identifies compounds which interact with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytomodulating lipophilic oligopeptide; immune system; inflammation; cytotoxic; lymphocytic; inhibition; cytokine; autoimmune disease; T (B cell; mononuclear phagocyte; septic shock; rheumatoid arthritis; Crohn's disease; colitis; allergy; transplant.
Identifying compounds which interact with target molecules - using enantiomers of the target molecules and testing of enantiomers of selected compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               00000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative:

    AAW82804 to AAW82829 are cytomodulating lipophilic oligopeptides. The oligopeptides are used to inhibit: (i) activity of lymphocytes cligopeptides are used to inhibit: (i) activity of lymphocytes.

(particularly cytotoxic T cells, but also natural killers, Becals and monouclear phagocytes); (ii) production of inflammatory cytokines, and (iii) an inflammatory response in mammals (e.g. in cases of septic.

Shock, rheumatoid arthritis (RA), Crohn's disease, colitis and allergy). They are also used for modulating activity of haem-containing enzymes and for delaying onset of autoimmune disease (specifically insulin-dependent diabetes mellitus, RA and systemic lupus erythematosus). In all cases the oligopeptides may be generated from nucleic acids, and treatments are in vitro or in vivo. A specific application is treatment of organs or calls for transplantation, or of the recipient of such treasplants.

The part from therapeutic use, the oligopeptides can be used to study mechanisms of T cell (de)activation and to raise antibodies (used to identify oligopeptides and to raise anti-idiotypic antibodies that are competitors of the oligopeptides. The oligopeptides are administered by the oligopeptides increases the life of the oligopeptides increases the life of

coreen for epitopes from the coding region of human ESO-1/CAG-3

ORF1 (see AAX58599). 30 Epitopes (see AAX0588-Y06017) were identified.

The present peptide (ranked 12) corresponds to amino acid residues

152-161 of CAG-1 ORF1 (see AAY05965). CAG-1 is a new and potent
tumour antigen capable of eliciting an antigen specific immune
cresponse by T (cells. Cancer peptides (see AAX05967-87) derived from
CAG-3, portions of CAG-3 and their variants, are useful as cancer
vaccines. A claimed method of preventing or inhibiting cancer
involves administering a cancer peptide, with or without an HLA
molecule. The cancer peptides form part of, or are derived
from, cancers such as primary or metastatic melanoma, thymoma,
C lymphoma, sarcoma, lung cancer, ilver cancer, leukaemia, uterine
cancer, cervical cancer, bladder cancer, kidney cancer and
adenocarcinomas such as breast, prostate, ovarian, pancreatic and

This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 coren for epitopes (see AAY0598-706017) were identified.

CORFI (see AAX5859) 30 Epitopes (see AAY0598-706017) were identified.

The present peptide (ranked 10) corresponds to amino acid residues is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells.

CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from cancers such as primary or metastatic melanoma, thymoma, from, cancers such as primary or metastatic melanoma, thymoma, cancer, cervical cancer, ludge cancer, ludge cancer, ludge cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and Example 10; Page 42; 88pp; English. Cancer antigen NY ESO1/CAG-3 10 AA; thyroid cancers. Sequence

Nuclear hormone receptor drug screens

```
binding reaction occurs in solution. The sensor peptide obviates the need to include a natural coactivator protein of the receptor in the mixture. Sequences AAY13571-587 represent examples of sensor peptides that can be
                                                         hormone receptor function. The methods use a sensor peptide covalently coupled to a detectable label, that provides direct, in vitro ligand-dependent binding to a nuclear hormone receptor. Panels of predetermined or randomized candidate sensors are readfly screened for receptor binding. The methods and compositions provide for efficient screening of modulators of nuclear hormone receptor function, without the use of cell- or gel-based steps. The methods are amenable to automated, cost-effective high throughput sorreening of chemical libraries for bloactive compounds. To ensure specificity and optimize binding, the sensor is generally present at sub-micromolar concentration and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bacteria; fungi; yeast; protozoa; virus; mycoplasma; filaria; plasmodia;

chemical coupling. Such are produced from bovine or human milk by chemical coupling. Such are produced from bovine or human milk by treatment for 2 hr with proceases, then centrifuging to remove fat and caidifying to pH 2 to precipitate proteins. The solution phase is then subjected to reverse-phase high-performance liquid chromatography (HPLC) and cation-exchange HPLC, the fractions adjusted to salt content below can cation-exchange HPLC, the fractions adjusted to salt content below growing Bifidobacterium bifidus and Escherichia coll in pregence of the fractions. Those fractions for which (Bw-B0). (Ew-E0) is at least 0.15 are selected where Bw = germ count after 16 hr culture of B. Difidus in 50 Biliker broth containing peptide at 0.2 mg/ml, BO = germ count under similar conditions in a peptide-free control. Bw = germ count after 16 hr culture of B. Difidus in 50 Biliker, broth containing peptide similar conditions in a peptide-free control. The peptides Aaw93865-W93888 are used to treat microbe-related control. The peptides Aaw93865-W93888 are used to treat microbe-related shoots and plasmodia, e.g. infections, inflammation, microbially induced tumours or degenerative disorders, diarrhees, colic, abnormalities in oral, intestinal or vaginal microflora, or caries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Variable domain; MOMP; major outer membrane protein; subunit vaccine; C. trachomatis infection; serotyping; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents an epitope of the major outer membrane protein (MOMP) of Chlamydia trachomatis. The invention relates to variable domain fragments of the MOMP of Chlamydia trachomatis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chlamydia trachomatis peptides - and DNA fragments encoding them
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conservative:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genomic sequences of tumour associated antigen EY-ESO-1 (LAGE-2) useful for diagnosing testicular tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAG67169-AAG67206 represent peptides which are derived from cancer testis tumour antigen NY-ESO-1 (also called LAGE-2). The peptides bind to human leukocyte antigens (HLAS). NY-ESO-1 is a molecule that is processed to at least one human leukocyte antigen (HLA) binding peptide, which binds to Class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of
serovar Ba, serovar D, serovar E, serovar F, serovar G, serovar H, serovar I, serovar J, serovar K, and serovar L3, and to DNA sequences encoding them. The peptides are useful in diagnostic tests for C trachomatis infections, serological tests for serotyping, and as subunit vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cancer testis tumour antigen NY-ESO-1 derived peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10

Sequence 7, Application US/09824807
Sequence 7, Application US/09824807
Patent No. US20020094966A1
GENERAL INFORMATION:
APPLICANT: Serrero, Ginette
TITLE OF INVENTION: 88 KDA TUMORIGENIC GROWTH FACTOR AND ANTAGONISTS
FILE REFERENCE: 29996.488/PP001-A
CURRENT APPLICATION NUMBER: US/09/824,807
CURRENT FILING DATE: 2001-04-04
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           APPLICANT: Serrero, Ginette

Patent No. US2002094966A1

GENERAL INFORMATION:

TITLE OF INVENTION: 88 KDA TUMORIGENIC GROWTH FACTOR AND ANTAGONISTS

TITLE OF INVENTION NUMBER: US/09/824,807

CURRENT FILING DATE: 2090-0484

PRIOR FILING DATE: 1997-12-16

PRIOR FILING DATE: 1997-12-16

PRIOR FILING DATE: 1997-05-23

NUMBER OF SEQ ID NOS: 17
                                                                                                                              FEATURE:
NAME/RET: PETIDE
LOCATION: (1)..(14)
OTHER INFORMATION: antisera against the GP88 used to raise the
OTHER INFORMATION: antisera against the GP88 used in the
OTHER INFORMATION: immunoaffinity step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FEATURE:

GENERAL INFORMATION:
APPLICANT: Proteom Lid
TITLE OF INVENTION: Complementary peptide ligands from the human genome
FILE REPREBENCE: Human patent
CURRENT APPLICATION NUMBER: US/09/572,404B
CURRENT APPLICATION NUMBER: 2000-05-17
NUMBER OF SEQ ID NOS: 4203
SEQ ID NO 389
LENGTH: 10
